

Requisitions

Optimize inventory distribution from central storage to multiple locations with SmartPO's comprehensive requisition management.

Centralized Inventory

SmartPO seamlessly adapts to various centralized inventory models. For example, senior living facilities benefit from SmartPO's ability to track distribution from main supply areas to satellite closets throughout their campuses. For primary care providers, SmartPO efficiently manages warehouse-style central storage that services multiple clinic locations, whether supporting all item needs or only certain essentials.

Intuitive Requisitions

SmartPO's Requisitions module mirrors the familiar purchase order workflow while providing specialized tools to transfer inventory from central storage to areas, departments, or off-site locations. Staff members can create requisitions using pre-built templates or SmartPO's responsive search-as-you-type feature, which instantly suggests relevant items.

Streamlined Fulfillment

Central supply personnel can generate detailed picking slips to guide the process of pulling requisitioned items. Inventory storage locations for each item eliminate search time and guesswork. As requisitions are fulfilled, SmartPO automatically executes real-time inventory transfers to the requesting locations and reduces stock levels in central supply.

Automated Replenishment

SmartPO actively monitors inventory levels and alerts users when supplies drop below established PAR thresholds. With a click, users can generate replenishment purchase orders to restore optimal inventory levels, eliminating both critical shortages and costly overstock. These purchase orders then follow SmartPO's approval processes before being delivered to each vendor.

Real-Time Reporting

SmartPO's robust reporting provides complete visibility into inventory utilization, including supplies movement from requisitions and transfers. Designated G/L codes for each item enable accurate internal charges.
